**Overview of Project:**

The goal of this project is to create a functional and useful application within a group. We will apply what we have learned in class to create our app and it should be simple enough so the user can use the app without struggle. It will include all functional and non-functional requirements with an appealing user interface. The work will be distributed evenly to ensure everyone participates and is able to apply their knowledge and improve communication skills.

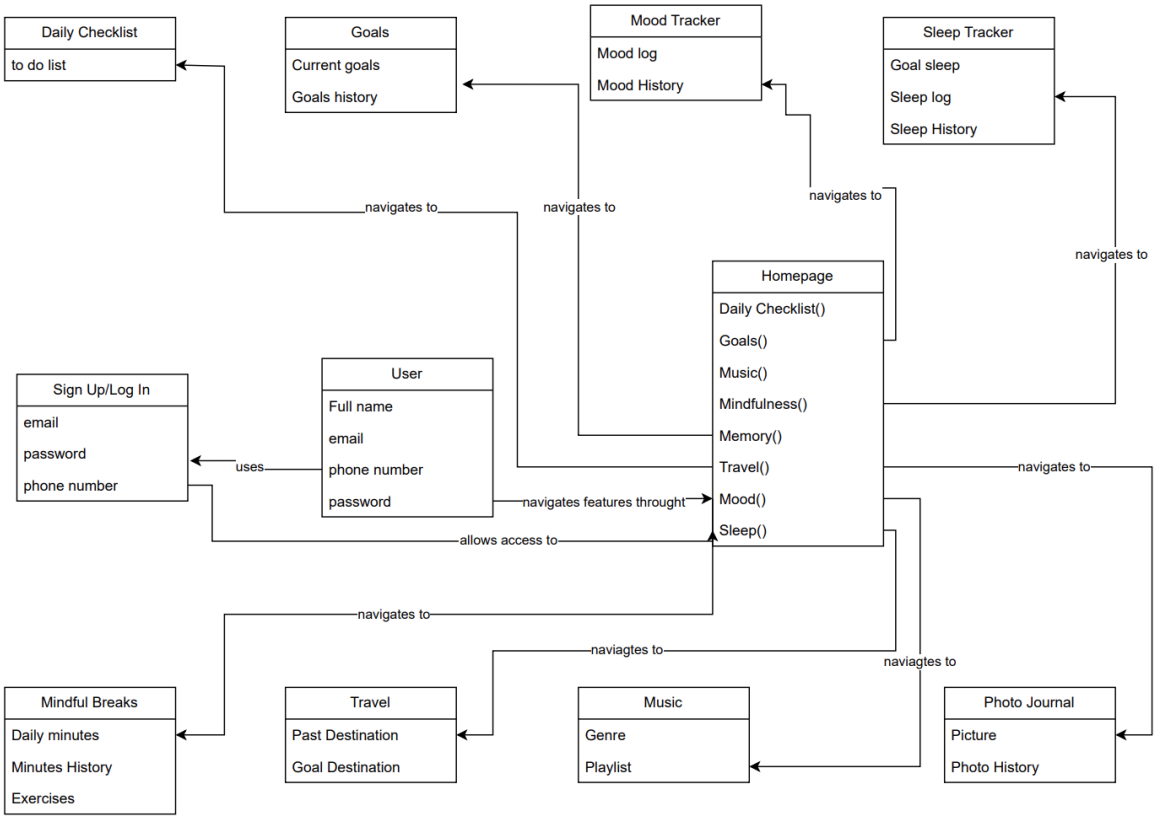

**List of Group Members with Responsibilities:**

- Alagu Vallikkannan (100822256): Daily Checklist + Goals
- Zareh Jamal-Sunderji (100819414): Mood Tracker + Sleep Tracker
- Chantel George (100825272): Mindful breaks + Sign Up
- Sara Bhoira (100826813): Homepage + Travel
- Michael DeMelo (100779096): Personalized Music + Memory

**List of Features and Functional Requirements:**

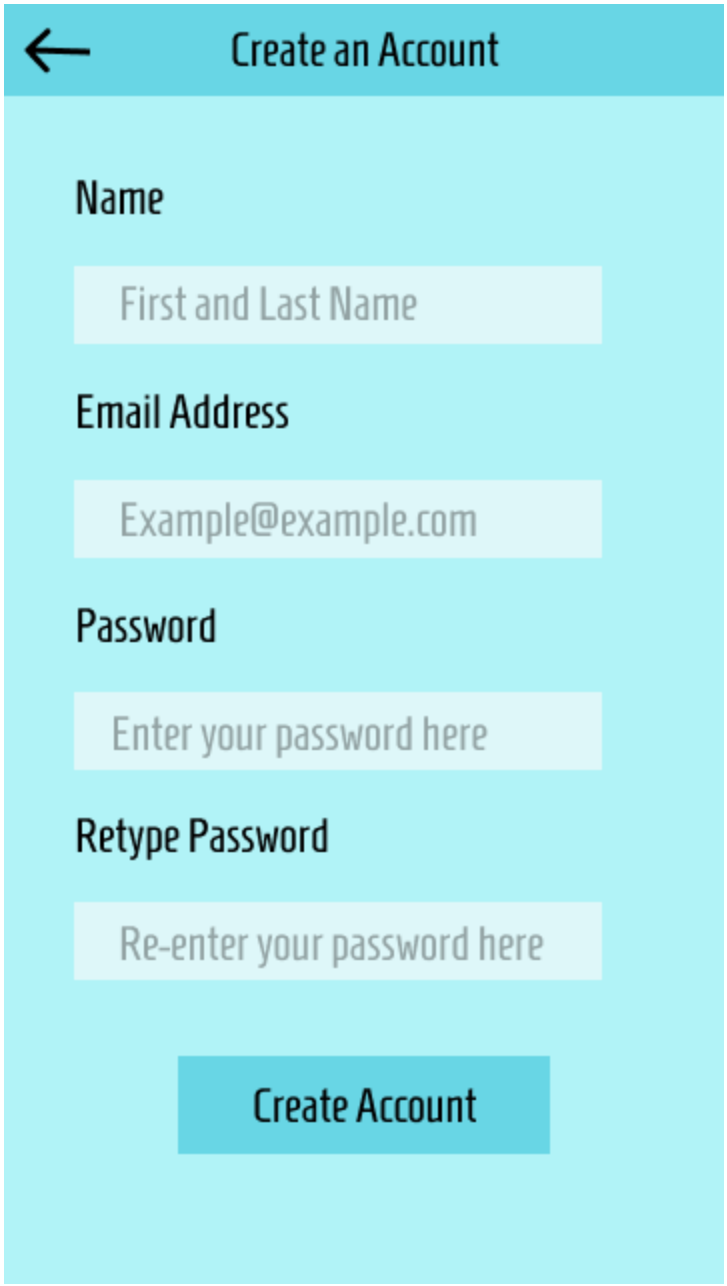

- The sign up page includes the user's information such as name, birthday, and email address
- A pop up that asks the user if they give access to track their data ( Shows up before entering the homepage)
- A homepage with multiple tabs that lead to other pages
- The goals page that sets a goal, sets a goal date, tracks how many days left to reach a goal. - % slider for their goal accomplishments and displays a positive messages
- Sleep tracker page that takes user input of their sleep goals and data
- Include a timer for users to set how long they want their mindful break to be when the notification is sent out to the users as a reminder to take them throughout the day
- The daily checklist page includes the regular todo list where users can highlight or star any main tasks they might have
- The personalized music page asks the users about what type of music they like, so that we can give recommendations for which songs they can listen to
- The travel goals page has a map where users can pin their travel plans on the map. The page also gets the user input about their travel goals, so that we can send them recommendations regarding their goals.
- Our app includes multiple pages that have snack bars, sends out notifications, and navigations. This allows the users to easily navigate through various features available through the app.

**Scope of Project:**

We are creating a health-like application that will take user input and help them reach their goal. The app will ask the user to sign-up and after they do so when they re-enter the app it will ask to allow tracking. There will be different options on the home screen for the user to choose from, it will take the user to another page where they can input the required information. After enough information is gathered the output will be displayed in another page along with mindful tips. There will be snack bars with confirmation of the action they had just done, notifications to keep the user on track and in good spirit and it will be easy to navigate the app because it will have familiar icons. There will be local and cloud storage to store the given data for safe and accurate tracking.
